On page 3 of the after-final remarks, applicant argues, in substance, that:

"...Postiff merely discloses a physical register file (PRF) 12 and a logical register file (LRF) 12, but neither element corresponds to the claimed "caching register" configured to cache the contents held by the register part, and particularly such that a register transfer instruction is issued "for transferring inner data between said caching register and said register part when said instruction insertion determining part determines that the inner transfer instruction is to be inserted". Stated another way, Postiff does not disclose or suggest that either the physical register file (PRF) 12 or logical register file (LRF) 10 are a caching register to provide a consistency between the cashing register and a register part by inserting and executing an instruction for loading or storing register data in accordance with the register of a subsequent instruction and caching information."

Though fully considered, these arguments are deemed non-persuasive by the examiner because paragraph [0030] sets forth that the reservation station (Fig.4, component 50) contains a source virtual register number (VRN). According to paragraph [0035], when an instruction is ready and scheduled for execution (inserted), its VRN value (inner data) is transferred from the reservation station to the PRF (caching register) so that the source operand required by the instruction is accessed. Hence, it can be seen that Postiff has taught "transferring inner data (VRN data) between said caching register (PRF) and said register part (both the LRF and reservation station make up the "register part") when said instruction insertion determining part determines that the inner transfer instruction is to be inserted."
